## Expressions & Equations

Understand that solutions to a system of two linear equations in two variables correspond to points of intersection of their graphs, because points of intersection satisfy both equations simultaneously.

I can convert equations from Standard Form to Slope-intercept form and vice versa.

What is slope-intercept form?

$$y = mx + b$$

What is standard form?

$$Ax + By = C$$

### Standard Form

\*A, B, and C are integers.  
\*A is positive

Steps to converting an equation from:

$$Ax + By = C \rightarrow y = mx + b$$

Standard Form to Slope-Intercept Form

Step 1:

move any term that is on the same side as y to the other side of the equal sign by adding or subtracting.

Step 2:

divide both sides of the equation by the coefficient in front of y.

Step 3:

If possible, simplify.

Example:

Convert  $4x + 2y = 8$  into slope-intercept form.

$$\begin{aligned} & -4x & -4x & \leftarrow \text{Step 1} \\ \frac{2y}{2} & = \frac{-4x + 8}{2} & \frac{2}{2} & \leftarrow \text{Step 2} \\ & & \leftarrow \text{Step 3 (Simplify)} & \\ y & = -2x + 4 & \leftarrow \text{Answer} & \\ & y = mx + b & & \end{aligned}$$

© 2015 Jenny Stafford

$$y = mx + b \rightarrow Ax + By = C$$

Slope-Intercept Form to Standard Form

Step 1:

Multiply both sides of equation by the LCD. (only need this step if fractions).

Step 2:

move the x term to the same side as the y term.

Step 3:

Multiply both sides of equation by -1 if needed to make A positive.

Example:

Convert  $y = -\frac{3}{4}x + 5$  into standard form.

$$\begin{aligned} & 4(y = -\frac{3}{4}x + 5) & \leftarrow \text{Step 1} & \text{LCD} = 4 \\ 4y & = -\frac{12}{4}x + 20 & \text{simplify fractions} & \\ 4y & = -3x + 20 & \leftarrow \text{Step 2} & \\ +3x & & & \\ 3x + 4y & = 20 & \leftarrow \text{Answer} & \\ & Ax + By = C & & \end{aligned}$$

Extra Example 5

$$\begin{aligned} x - y & = 3 \\ -x & & & \\ \hline -y & = -x + 3 \\ -1 & & & \\ \hline y & = x - 3 \end{aligned}$$

Extra Example 6

$$\begin{aligned} 2y & = \frac{2}{3}x - \frac{2}{3} & \text{LCD} = 12 \\ 12(2y = \frac{2}{3}x - \frac{2}{3}) & & & \\ 24y & = 8x - 8 & \text{simplify fractions} & \\ 24y & = 8x - 8 & & \end{aligned}$$
